CHART BOOK  
— OF —  
EMPLOYMENT AND PAYROLLS IN CERTAIN INDUSTRIES.

FOREWORD.

The present Chart Book of Employment and Payrolls in certain industries is the second publication of the kind put out by the Dominion Bureau of Statistics, continuing a series of graphs established during the war by the Wartime Prices and Trade Board, and later prepared by the Department of Reconstruction and Supply.

The charts depict the course of employment as reported by the larger industrial establishments in the period from 1939 to March 1, 1948, while in the case of the payrolls, the figures relate to the period from June 1, 1941, when the monthly record of salaries and wages was instituted. The index numbers based on June 1, 1941, have been charted in their original form, and in the form of 12 months' moving averages centered; since each item in the latter series is the average of an entire year, the seasonal fluctuations are largely eliminated, with the result that the trends over a period of years are more readily discerned.

The graphs plotted in the charts in the following pages represent the trends of employment and payrolls in establishments usually employing 15 persons and over. For practical reasons associated with the costs of collection and processing, in terms of money and of time, the smaller businesses are excluded from the monthly surveys. This limitation of their scope results in an unequal coverage of the total employment in the various industries for which data are available, depending upon whether they are usually organized in large or small units of production or operation. However, comparatively high proportions of the total wage-earners employed in the various industrial divisions are represented in all cases. Thus the charts for the individual industries may be regarded as accurately depicting the fluctuations in employment and other payroll data portrayed.

Except in the predominantly agricultural provinces of Prince Edward Island and Saskatchewan, the provincial coverage of total employment is relatively high, and also shows a considerable degree of uniformity. At the date of the last Decennial Census, (June 1, 1941), the monthly survey's percentages of coverage of the total wage-earners and salaried employees in all agricultural and non-agricultural industries varied from 52 p.c. in New Brunswick to  $64\frac{1}{2}$  p.c. in Ontario, while the Dominion proportion was 59 p.c.; the proportions in Prince Edward Island and Saskatchewan were relatively low, at 19 p.c. and 31 p.c., respectively. In the categories included in the monthly surveys, the range in the more industrialized provinces was also from seven points below in the case of New Brunswick to  $5\frac{1}{2}$  points above in Manitoba. In this comparison also, the figures in Prince Edward Island and Saskatchewan were below-average, at 40 p.c..

and 64 p.c., respectively. The general coverage in Canada at the Census date was over 79 p.c., a proportion which since has increased. While these provincial variations are not particularly marked, they warrant consideration in a study of the regional trends. It should also be remembered that certain of the industries excluded from the monthly surveys, notably agriculture, domestic service, etc., did not share in the wartime expansion of employment which had particularly affected manufacturing and a few other divisions, in which the establishments furnishing monthly statistics employ exceedingly large proportions of the total working force.

Attention is also drawn to the fact that since the termination of the war, the situation in many industries has been seriously affected from time to time by industrial disputes\*. In some cases, these strikes indirectly affected the levels of employment and payrolls in numerous other industries. During 1946, the labour-management disputes in manufacturing were of considerable magnitude. In 1947, the strike in coal mining in Nova Scotia accounted for the greatest loss in man-days of work.

In certain charts, curves are shown for industries which employ comparatively small numbers of persons, so that minor changes will sometimes appear of greater significance than their size warrants. In connection with this point, attention is drawn to the statistics of numbers of employees reported by the co-operating establishments, as shown on Pages III to VI. These tables indicate the industrial and geographical distribution of the employees reported by the firms furnishing statistics at Mar. 1, 1948, together with the index numbers of employment as compared with the same date of earlier years:

- (1) 1939, taken as representative of the levels existing before wartime influences had any marked effect upon the situation.
- (2) 1944, when recorded employment was at its wartime peak for the late winter.
- (3) 1946, when industrial employment was at its post-war low point, and
- (4) 1948, when the period of reconversion had been virtually completed.

The charts in this volume have been adapted and many of them redrawn and remounted by Mr. J.W. Delisle, Chief Draughtsman of the Bureau.

A COMPARISON OF EMPLOYMENT AS REPORTED BY LEADING FIRMS REGIONALLY,  
AND IN SPECIFIED INDUSTRIES, AT MARCH 1, 1948,

with:

1. Mar. 1, 1939, as representative of pre-war levels in the late winter.
2. Mar. 1, 1944, when employment was at the wartime peak for the late winter.
3. Mar. 1, 1946, when the post-war reconstruction was in progress.
4. Mar. 1, 1947, when the period of reconversion was largely completed.
